

ABSTRACT OF THE DISCLOSURE

An electroluminescence light emitting device having: an electroluminescence light-emitting layer containing electroluminescence light-emitting elements therein; an electrode section having first and second electrodes which are disposed on one surface side of the electroluminescence light-emitting layer and have a predetermined pattern in which the first and second electrodes are electrically separated from each other with a spacing region; a top coating layer, which is disposed on the other surface side of the electroluminescence light-emitting layer, and on a front surface of which an electrically conductive material is attachable to form an alternating current electric field in the electroluminescence light-emitting layer by an alternating current power supply voltage applied between the first and second electrodes; the top coating layer having a compound additive containing dielectric; and a waterproof layer which is provided between the electrode section and the electroluminescence light-emitting layer.
